RustServer Platform

Self-hosted administration and deployment platform for Rust Dedicated Server.

A personal engineering project focused on operating a dedicated Rust server through a web interface: lifecycle management, controlled updates, plugin deployment, world backups, and recovery.

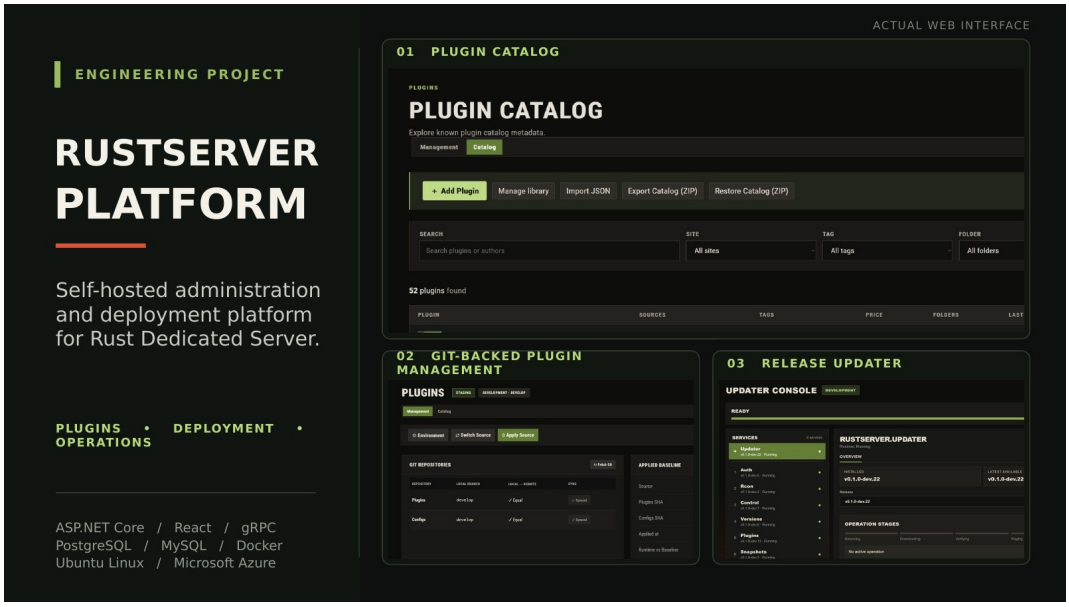

ASP.NET Core · React / TypeScript · gRPC · PostgreSQL · Docker · Ubuntu Linux · GitHub Releases

Project presentation

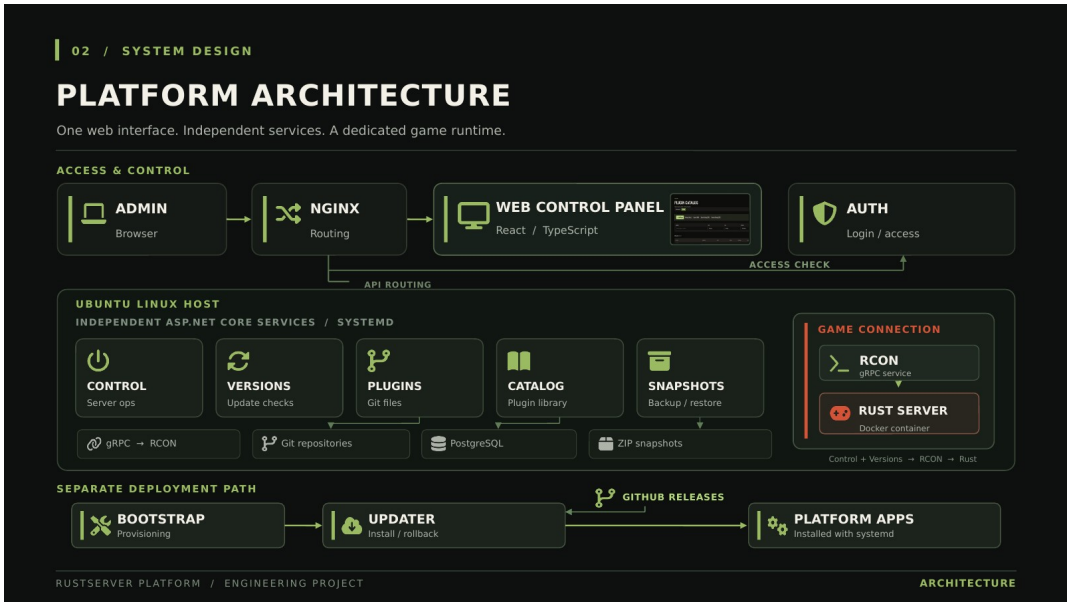

Four slides covering the platform, its architecture, capabilities, and operational workflows. Select any slide to open its full-size image.

01 — Platform overview

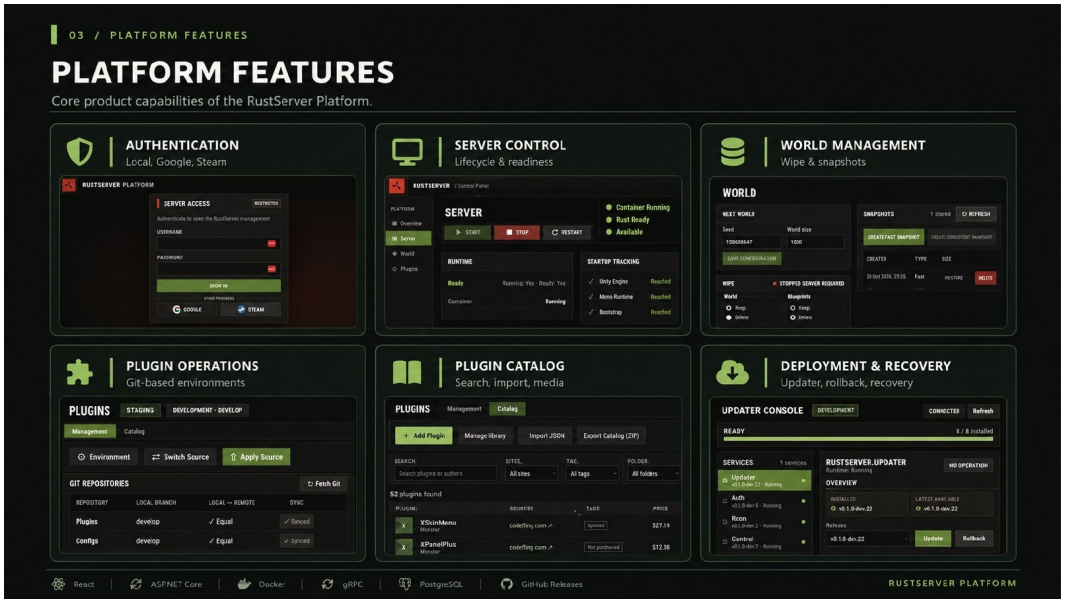

A look at the web interface, plugin catalog, Git-backed plugin management, and release updater.

02 — Platform architecture

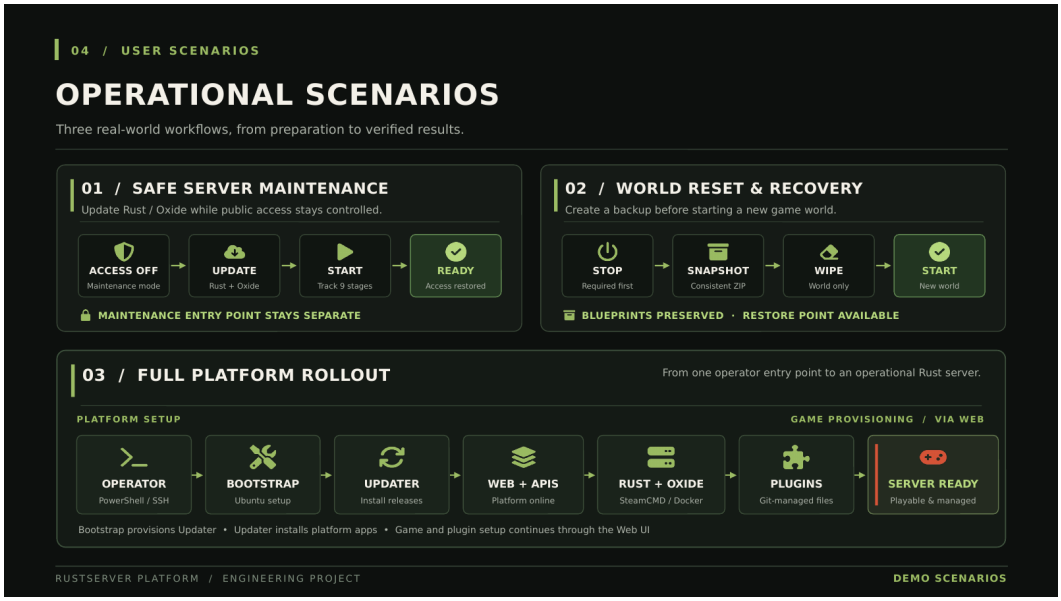

Web access and authentication, independently hosted ASP.NET Core services, Rust game runtime, and the separate bootstrap/update path.

03 — Platform features

Authentication, server control, world management, plugin operations, catalog, and deployment/recovery.

04 — Operational scenarios

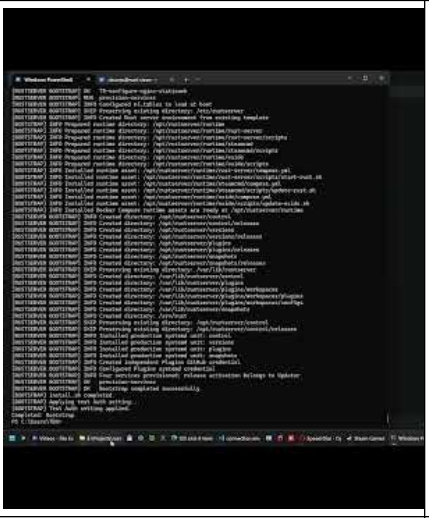

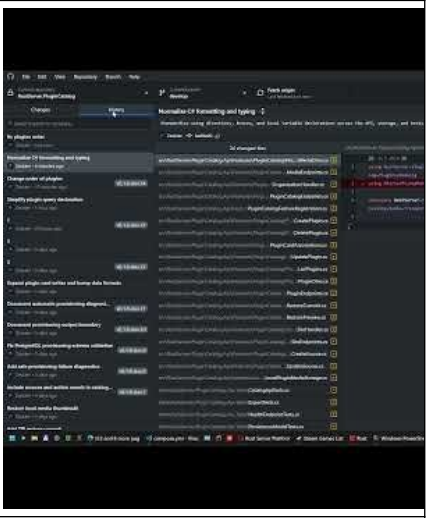

Safe maintenance, world reset with a restore point, and the full platform rollout from bootstrap to an operational server.

Source code

The source/ directory contains **public snapshots of the platform's source repositories**, grouped by component. Development and deployment continue in separate private repositories; this showcase is intended for browsing and technical review, not as a unified build repository.

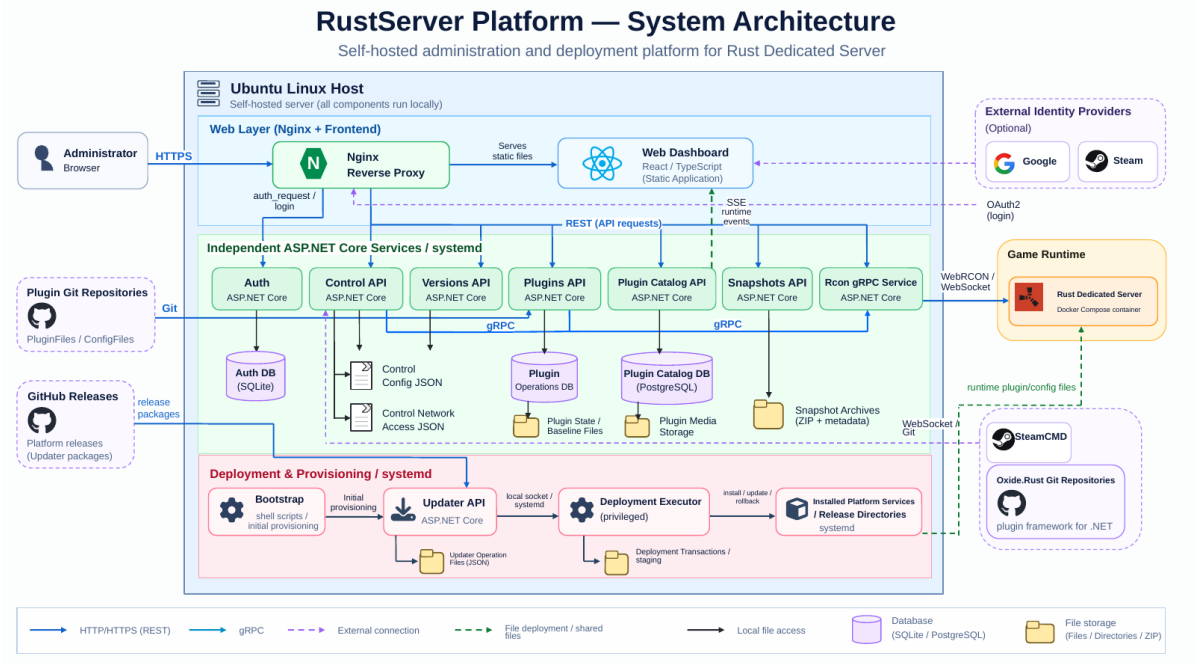

Component	Area
RustServer.Auth	Authentication and access
RustServer.Control	Server lifecycle and operations
RustServer.PluginCatalog	Plugin catalog
RustServer.Plugins	Git-backed plugin operations
RustServer.Rcon	Communication with the Rust game server
RustServer.Snapshots	Backup and restore
RustServer.Updater	Platform deployment and rollback
RustServer.Versions	Software version checks
RustServer.Web	React / TypeScript administration UI
rust-server-platform	Platform setup and bootstrap

> **Note:** The source tree is a publication snapshot, not the original development history. Each component is maintained in its own repository.
